

Company

The success story of the ELM Group began in 1998 with the founding of ELM Recycling GmbH & Co. KG as an environmentally-oriented company in Bissingen/Teck. Through solid organic growth, investments and acquisitions, ELM has grown into a group of companies with 12 companies at eight locations in Baden-Württemberg and Bavaria.

All of our locations are certified waste disposal companies that accept a wide variety of waste and production residues from industrial and commercial companies, as well as packaging and sorting residues of commercial and private origin from waste treatment and sorting plants.

Through targeted processing in modern recycling plants, valuable raw materials are recovered from this waste for the economic cycle. The non-recyclable parts are used to produce high-quality substitute fuels, which largely replace fossil primary energy sources in cement production and thus ensure significant CO2 savings.

With its ecologically oriented processing plants, our group of companies makes a significant contribution to resource conservation, environmental protection and sustainability as a result of its own innovative strength.

Fields of activity

The ELM Recycling Group is a service provider in the field of waste disposal as well as in the supply of industrial companies with secondary raw materials and alternative energy sources. It links supply and demand with the processing of waste in its own recycling plants. The focus of its activities is the production of high-quality recycled products and substitute fuels for ecologically oriented recycling as a basis for the development of a circular economy.

Associations

bvse – Bundesverband Sekundärrohstoffe und Entsorgung e.V.

BGS e.V. – Gütegemeinschaft Sekundärbrennstoffe und Recyclingholz e.V.

ELM RECYCLING GMBH & CO. KG

Foundation

- 1998

Head of Recycling Materials

Selected, pre-sorted high-calorie waste from industry and commerce as well as energy-rich and no longer recyclable packaging waste are processed into high-quality substitute fuels.

We process pure plastic waste into high-quality secondary raw materials. When processed into ground materials, they achieve almost the same product properties as new goods and thus contribute to more sustainable economic activity.
