ENZYMICALS

We deliver concept-to-completion comprehensive solutions to create high-performance protein-based products and processes. For this, we discover and produce enzymes based on the demands of our customers and partners. Our technology platform covers the identification of suitable catalysts from strain or enzyme collections, databases, or metagenome libraries as well their functional expression in a range of microbial host systems. This enables us to offer tailor-made protein expression and optimisation as a service. Thus almost any biocatalyst of interest can be supplied on an analytical and commercial scale. A catalyst suitable for the production of your target compound can be optimised via our protein engineering technology to provide the best performance available.

Together with our network partners, we have expanded our service to ASMF filing, regulatory affairs, cGMP production, and bulk scale supply. The combination of best catalysts with optimised chemistry and the integration of processing aspects have enabled us to increase the speed of delivery of effective solutions and expand our business along the whole value chain of the white biotechnology industry.
